But it's a whole lot more than just having a word in a high volume/high pressure speech to get attention. So you'll need to decide if there's something more to the word that you want to emphasize. And if there is, what the particular point is that the word conveys. The Point. In the original "The Point" film, It wasn't even really necessary to see the point – but the point was all you needed to know. The point of the speech was that he was going to have sex with the president's daughter. And it was obvious that the point was how absolutely scandalous it was – and so it was. But the point wasn't just that it was scandalous – it was that it was going to be done. The point was it was going to be done. The point was that he was going to have sex with the president's daughter. It was a violent, explicit threat that was going to be carried out. The Point of The Speeches So now let's look at this speech. All the speech does is tell us what the next thing is that the president is going to do. The point of the speech isn't to tell us that it's going to be done. The point of the speech is to tell us what it's going to be done. This isn't a threat to have sex with a dog. It's a threat to murder a dog. And so it needs to be told. That's what the point of the speech is. Let's look at one more example. a1d647c40b

This study was carried out to investigate the fetal and neonatal bone turnover markers in osteogenesis imperfecta (OI) and to determine whether they reflect the disease severity and to what extent the decrease of the markers reflects the presence of bowing and pseudarthrosis. A total of 81 neonates diagnosed with OI were included. Fifty-three neonates were normal children, while the remaining 28 were infants with congenital OI. The bone turnover markers were measured using the enzyme-linked immunosorbent assay. The values of the bone formation marker (osteocalcin) and the bone resorption marker (deoxyypyridinoline cross-linked N-telopeptide) in newborns with OI were significantly lower than those in normal newborns. The mean levels of both bone turnover markers significantly correlated with the modified Gartland score. However, no correlation was observed between the levels of the bone turnover markers and the presence of bowing or pseudarthrosis. The results suggest that the bone turnover markers are useful for detecting the disease and for the evaluation of its severity. However, their sensitivity and specificity are low. Gare d'Aix-
