I'm working on an application that will take data from an external device and store them in a database. The device will transmit data to the database through UDP. I've read many things about PHP, but it seems like most of the tutorials are on receiving text messages and i need to receive UDP packets. Could anyone help me? A: You can use the socket_receive and socket_read functions to read data from a socket. For UDP messages, you'll need to read a few bytes from the socket into a buffer, check the "length" of the buffer, and then figure out if it's a message that you can handle. A: I have been doing this kind of thing for a while. I use the free script "dionaea" which has functions for this: Receive from UDP (by receiving port and remote ip) Decode from binary to text (decode bit pattern, here from integers to integer values) Decode binary text to "human-readable" text (decode text to binary) Example usage:
